Behavior: tense, no aggression, OK to work with, muzzled out of precaution

A: Patient is fit for surgery

P: Surgery Report- Dog Neuter

Anesthesia

Pre-anesthetic: Acepromazine (2mg/ml) 0.5 cc IM, Butorphanol 10mg/ml: 0.75 cc IM,

Ampicillin 200mg/ml: 2.91 cc SQ

Induction: Ketamine (100 mg/ml) 1.2 cc IV, Midazolam (5 mg/ml) 1.2 cc IV

Intubation: Endotracheal tube size 9

Maintenance: Oxygen 1L Isoflurane 2%

Monitoring: Pulse oximeter

Supportive care: Thermoregulation pad/blanket

A testicle was pushed up in the scrotum on the median raphe area and a slightly off midline incision was made over the testicle (#10). The testicle was then exteriorized and freed of subcutaneous and connective tissue, manually with gauze. A carmalt was then placed over the vas deferens, cremaster, and vessels proximal to the epididymus. A single ligature (Miller's knot, 2-0 PDS) was placed proximal to the clamp and the testicle removed distal to the clamp. The clamp was then removed and the stump checked for bleeding. This procedure was repeated on the second testicle. The subcutaneous tissue was apposed using a single cruciate suture of 2-0 Monocryl. Tissue glue was placed on the skin.

Intradermal tattoo placed

Rx: Azithromycin 250 mg PO SID x 7 days

Doxycycline 300 mg PO SID x 10 days

Surgeon:

AZITHROMYCIN
